

1 ABSTRACT OF THE DISCLOSURE

          A semiconductor device which receives  
addresses in synchronism with a clock signal and  
receives data in synchronism with a strobe signal  
5 includes address-latch circuits, a first control  
circuit which selects one of the address-latch  
circuits in sequence in response to the clock signal,  
and controls the selected one of the address-latch  
circuits to latch a corresponding one of the addresses  
10 in response to the clock signal, and a second control  
circuit which selects one of the address-latch  
circuits in sequence in response to the strobe signal,  
and controls the selected one of the address-latch  
circuits to output a corresponding one of the  
15 addresses in response to the strobe signal.
